Detailed description of the invention

5

The compounds of the invention can be prepared from corresponding phenol derivatives (IV), wherein R_2 , R_3 , X, Z and Y are the same as defined above.

10

The syntheses are shown in Scheme 1, wherein formula (IV) is abbreviated as Ar-OH (IV). Pyridin-2-yloxy derivatives (1) are obtained by reactions with a suitable halopyridines (2) where R_1 can be hydrogen, nitro, cyano, halogen, or amide and X_1 chlorine or bromine. The nitropyridine and nicotinamide derivatives can be reduced to corresponding amines (3) and (4), respectively.

15

SCHEME 1.

20

The reaction of 2-chloro-5-chloromethylpyridine (5) with diethylamine results in (6-chloropyridin-3-ylmethyl)diethylamine (6), which in turn can be reacted with phenol derivatives (IV), as shown in Scheme 2.

SCHEME 2.

10 Nicotinic acid derivatives (12) and their esters (11) are obtained as shown in Scheme 3. The esterification of 6-chloronicotinic acid and its reaction with phenol derivatives (IV) gives nicotinic acid ester derivatives (11) (R can be lower alkyl). Nicotinic acid derivatives (12) are obtained upon hydrolysis.

SCHEME 3.

15 The aminopyridine derivatives (3) are reacted with suitable amino acids and other carboxylic acid derivatives using 1-(dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride as a coupling agent to result in amide derivatives (13) as shown in the following Scheme 4 wherein R₅ is as defined above. Optionally the amide

20

derivatives of (13) can be obtained by well-known acylation methods. Protecting groups are removed if needed.

SCHEME 4.

4-(4-methylpiperazin-1-ylmethyl)benzoic acid (17) is obtained as described in the following Scheme 5. 4-Chloromethylbenzoic acid (14) is first esterified to a methyl ester to protect an acid group in the following reaction. 4-Chloromethylbenzoic acid methyl ester (15) is then allowed to react with 1-methylpiperazine to give 4-(4-methylpiperazin-1-ylmethyl)benzoic acid methyl ester (16). Methyl ester is cleaved by heating with potassium hydroxide in methanol. 4-(4-methylpiperazin-1-ylmethyl)benzoic acid is reacted as described above in Scheme 4 with aminopyridine derivatives (3) to result in *N*-4-(4-methylpiperazin-1-ylmethyl)benzamide derivatives of (13). By a similar manner other *N*-4-(piperazin-1-ylmethyl)benzamide derivatives of (13) can be prepared.

SCHEME 5

The 2-chloroacetamide derivatives (13') where R_5 is CH_2Cl are reacted with sodium azide to result in azide derivatives (18) which in turn are reduced to corresponding 2-aminoacetamide derivatives (19) as shown in the following Scheme 6 wherein R_7 and R_8 are as defined above. The acetamide derivatives (20) are obtained from 2-chloroacetamide derivatives (13') by reaction with various amines. The amide moiety of acetamide derivatives (20) can be reduced in order to result in corresponding amines (21).

SCHEME 6

As shown in the following Scheme 7, wherein R_2 and R_3 are the same as defined above, 6- and 7-hydroxyflavane derivatives (23) are obtained from corresponding flavanones (22) by Clemmensen reduction. 6- and 7-hydroxyflavanones (22) are commercially available or can be synthesised by methods described in the literature, e.g. *J. Org. Chem.*, 1960, 25, 1247-9 and *J. Org. Chem.*, 1958, 23, 1159-61 or as described later in Scheme 9.

SCHEME 7.

The following Scheme 8, wherein R₂ and R₃ are the same as defined above, describes the synthesis of 2-phenyl indan-5-ols (30). Condensation of *p*-anisaldehyde (24) with substituted phenyl acetic acid (25) gives mixture of *cis*- and *trans*-isomers of the corresponding acrylic acid (26). After hydrogenation and intramolecular Friedel-Crafts reaction carbonyl functionality of 1-indanones (28) can be reduced by Clemmensen reduction. Finally methoxy indane (29) is refluxed in concentrated hydrobromic acid to obtain 2-phenyl indan-5-ols (30).

10

SCHEME 8

6-Hydroxyflavanone derivatives can be synthesised as shown in Scheme 9 wherein R_2 , R_3 and R_{12} are as defined above. 2',5'-Dihydroxyacetophenone or corresponding propiophenone (32) is condensed with appropriate benzaldehyde (31) resulting in a mixture of desired 6-hydroxyflavanone (34) and the corresponding chalcone (35). The chalcone can be cyclised to flavanone.

SCHEME 9

The benzaldehyde derivatives of (31) wherein R_2 and R_3 can contain pyridine moiety are obtained by the reaction of hydroxybenzaldehydes (35) with pyridine derivatives (36) (where X_1 can be chlorine or bromine and R' hydrogen, nitro or halogen) as shown in Scheme 10.

SCHEME 10

2-Phenylchroman-4,6-diol derivatives (39) are obtained from corresponding 6-hydroxyflavanones (38) by reduction as shown in Scheme 11 wherein R_2 , R_3 and

R₁₂ are as defined above. These diol derivatives can be reduced further into 6-hydroxyflavanes (40).

5

SCHEME 11

The following Scheme 12, wherein R₂ and R₃ are the same as defined above, describes the synthesis of 7-hydroxyisoflavones (45) and 7-hydroxyisoflavans (46). Acylation of 3-methoxyphenol (41) with substituted phenyl acetic acids (42) gives the corresponding 2-hydroxydeoxybenzoins (43) which can be cyclised with triethyl-orthoformate to yield isoflavones (44). Deprotection with hydrobromic acid and catalytic hydrogenation gives 7-hydroxyisoflavans (46).

13

SCHEME 12

5 The following Scheme 13 describes the synthesis of 2-phenyl-2,3-dihydrobenzo[1,4]oxathin-6-ol (50). The reaction of 2-mercaptobenzene-1,4-diol (47) with styrene epoxide (48) in the presence of base gives sulphide (49). The ring closure with an acid ion exchanger affords 2-phenyl-2,3-dihydrobenzo[1,4]oxathin-6-ol (50).

10

14

SCHEME 13.

5

The following Scheme 14 describes the synthesis of 6-phenyl-5,6,7,8-tetrahydro-naphthalen-2-ol (55) and 6-hydroxy-2-phenyl-3,4-dihydro-2*H*-naphthalen-1-one (54). Palladium catalyzed α -arylation of 6-methoxy-1-tetralone (51) gives 6-methoxy-2-phenyl-3,4-dihydro-2*H*-naphthalen-1-one (53) which after demethylation leads to the phenolic compound (54). Reduction with triethylsilane gives 6-phenyl-5,6,7,8-tetrahydronaphthalen-2-ol (55).

SCHEME 14.

15

The following Scheme 15, wherein R_2 and R_3 are as defined above and R'' is an appropriate protecting group, describes the synthesis of 2,3-dihydro-2-phenyl-benzo[1,4]dioxin-6-ols (60). After the protecting hydroxyl groups of 2,5-dihydroxyacetophenone are removed, this ketone rearranges with peracids and gives a phenol (56) after hydrolysis. The phenol (56) is condensed with a haloketone and after reduction and removal of protection groups the hydroxyphenol (59) is cyclised to a 2,3-dihydro-2-phenyl-benzo[1,4]-dioxin-6-ol (60).

SCHEME 15

Dihydroxyflavane derivatives (61) can be reacted with pyridine derivatives in a similar manner as described for compound (1) in Scheme 1. 4-Chromanol derivative of (62), where R* is OH, can be reduced to corresponding flavane with triethylsilane in acidic media. 5-nitropyridine derivatives (62) are reduced to corresponding 2-aminoderivatives (63), which in turn can be acylated or mesylated or reacted with various aminoacid- or carboxylic acid derivatives as described in Scheme 4 for compound (13).

SCHEME 16

When the nitro group in the benzyloxy derivatives (65) is reduced by hydrogenation using palladium as catalyst there are obtained [6-(5-aminopyridin-2-yloxy)chroman-2-yl]phenol derivatives (68) which in turn can be acylated or mesylated. These phenol derivatives (69) can then be reacted with pyridine derivatives (2) to result in derivatives like (70) as shown in the following Scheme 17. The reduction with zinc leads to amines like (66) which in turn can be acylated, mesylated or reacted with various amino acid- or carboxylic acid derivatives as described in Scheme 4 for compound (13).

SCHEME 17

Alkyl derivatives of aminopyridines (3) can be obtained by reductive amination as shown in Scheme 18 for dimethylamine derivatives (71). In the course of the reaction the amine moiety is partially rearranged from 5 to 4 position.

SCHEME 18.

The following Scheme 19, describes the synthesis of 1-methyl-3-(pyridinyl)thiourea (73) and *N*-methyl-*N'*-(pyridynyl)guanidine (74) derivatives. Aminopyridine derivatives (3) were reacted with methyl isothiocyanate to result in thiourea derivatives (73), which in turn were treated first with methyl iodide and then with methanolic solution of ammonia in order to obtain guanidine derivatives (74).

SCHEME 19.

EXPERIMENTS

The effects of the compounds of the invention were tested on ouabain-induced arrhythmias in guinea-pig papillary muscles.

Methods

Guinea-pig papillary muscles were mounted into horizontal muscle cuvette. A hook connected to force transducer was attached to another end of the muscle. Muscle preparations were electrically paced at 1 Hz with field stimulation via platinum electrodes. Modified Tyrode solution was used for superfusion of muscle preparations. The composition of the Tyrode solution was the following (mM): NaCl 135, $\text{MgCl}_2 \times 6\text{H}_2\text{O}$ 1, KCl 5, $\text{CaCl}_2 \times 2\text{H}_2\text{O}$ 2, NaHCO_3 15, $\text{Na}_2\text{HPO}_4 \times 2\text{H}_2\text{O}$ 1, and glucose 10. The Tyrode solution was gassed with carbogen (95% O_2 , 5% CO_2) to set pH at 7.4. Experiments were carried out at 37 °C. Acquisition and analysis of twitch tensions with Action Potential and Force Measurement System (ACFO v1.0, Fision Ltd, Finland).

Inhibition of ouabain-induced arrhythmias

Ouabain by blocking of sodium-potassium ATPase increases intracellular sodium which is changed for calcium via NCX. Increased intracellular calcium is leading to overload of sarcoplasmic reticulum (SR) and spontaneous calcium release from SR inducing delayed afterpolarizations (DADs). Equivalence for DADs in force signal is aftercontractions (ACs) which are seen as spontaneous twitches after the pacing controlled twitch.

The antiarrhythmic effects of the title compounds of Examples 13, 33, 14a and 14b were examined. The results are shown in Figures 1 to 3. Figure 1 shows the effects of the compounds on the start time of fast rise of ouabain-induced aftercontractions. Figure 2 shows the effects of the compounds on the maximum heights of ouabain-induced aftercontractions in guinea-pig papillary muscles. Figure 3 shows the effects of the compounds on the time to maximum heights of ouabain-induced aftercontractions in guinea-pig papillary muscles.

In general, the compounds of the invention delayed appearance and decreased the amplitude of aftercontractions. The title compound of Example 33, at 10 μ M concentration, was able to inhibit completely the emergency of ouabain-induced second aftercontraction.
